

Installing and Pointing The Long Ranger Properly

Every Long Ranger comes with a handy dandy installation manual which goes over in great detail the finer points of setting up The Long Ranger, but there are a few highlights and things to keep in mind for best results:

FOR BEST RESULTS:

- Use minimum cable length for minimal loss. Be aware that The Long Ranger natively has an N-Female connection, so you'll want cable terminated with N-Male connectors or an adapter.
- Maximize antenna height. This is a general rule for antennas – you'll want to place them as high as possible. The Long Ranger can be a challenge to place on a rooftop, but that's where it should live if possible. If not...
- Find a clear line of sight, or as clear as possible. You may not be able to see your nearest cell tower but try and keep obstructions away from the line of sight of the antenna.
- Do not bend the cable or connectors. Should be pretty self-explanatory why this isn't a great idea.
